CLAIMS

What is claimed is:

- A method of adjusting the power headroom in a mobile station, comprising:
 receiving a load indication from a base station indicative of a reverse link load;
 and
 - adjusting the power headroom of the mobile station based on the load indication.
- 2. The method of claim 1 wherein receiving a load indication from a base station comprises receiving the load indication in an upper layer message.
- 3. The method of claim 2 wherein the upper layer message is received over a common control channel.
- 4. The method of claim 1 wherein receiving a load indication from a base station comprises receiving a periodic load indication.
- 5. The method of claim 4 further comprising filtering the periodic load indications received over two or more periods to generate a filtered load estimate.
- 6. The method of claim 5 wherein adjusting the power headroom of the mobile station based on the load indication comprises adjusting the power headroom as a function of the filtered load estimate.
- 7. The method of claim 4 further comprising calculating a load tracking value based on two or more periodic load indications.
- 8. The method of claim 7 wherein calculating a load tracking value based on two or more periodic load indications comprises calculating a weighted average of two or more periodic load indications.

- 9. The method of claim 7 wherein calculating a load tracking value based on two or more periodic load indications comprises calculating a running average of two or more periodic load indications over a sliding time window.
- 10. The method of claim 7 wherein calculating a load tracking value based on two or more periodic load indications comprises evaluating a continuous load tracking function that converts discrete periodic load indications from the base station to a continuous load tracking value.
- 11. The method of claim 7 wherein adjusting the power headroom of the mobile station based on the load indication comprises determining the power headroom threshold as a function of the load tracking value.
- 12. The method of claim 11 wherein determining the power headroom threshold as a function of the load tracking value comprises adjusting the power headroom threshold linearly based on changes in the load tracking value.
- 13. The method of claim 11 wherein determining the power headroom threshold as a function of the load tracking value comprises adjusting the power headroom threshold non-linearly based on changes in the load tracking value.
- 14. A mobile station comprising:
 - a receiver for receiving load indication from a base station;
 - a transmitter for transmitting signals to the base station at a variable data transmission rate dependent on the load indication; and
 - a controller to vary a power headroom threshold for the transmitter based on the load indication from the base station.
- 15. The mobile station of claim 14 wherein the power headroom threshold limits the data transmission rate of the mobile station.

- 16. The mobile station of claim 14 wherein the load indication is received from the base station in an upper layer message.
- 17. The mobile station of claim 14 wherein the load indication is a periodic load indication.
- 18. The mobile station of claim 17 wherein the controller calculates a load tracking value based on two or more periodic load indications and determines the power headroom threshold as a function of the load tracking value.
- 19. The mobile station of claim 18 wherein calculating a load tracking value based on two or more periodic load indications comprises calculating a weighted average of two or more periodic load indications.
- 20. The mobile station of claim 18 wherein calculating a load tracking value based on two or more periodic load indications comprises calculating a running average of two or more periodic load indications over a sliding time window.
- 21. The mobile station of claim 18 wherein calculating a load tracking value based on two or more periodic load indications comprises evaluating a continuous load tracking function that converts discrete periodic load indications from the base station to a continuous load tracking value.
- 22. The mobile station of claim 18 wherein the controller adjusts the power headroom threshold linearly based on changes in the load tracking value.
- 23. The mobile station of claim 18 wherein the controller adjusts the power headroom threshold non-linearly based on changes in the load tracking value.
- 24. A method of adjusting the power headroom in a mobile station comprising: counting the number of times the mobile station is power limited for a retransmission of a frame; and

- adjusting a power headroom threshold of the mobile station based on the count.
- 25. A mobile station comprising:
 - a transmitter for transmitting signals to the base station at a variable data transmission rate;
 - a power outage counter for counting the number of times that the mobile station is power limited for a retransmission of a frame; and
 - a controller to vary a power headroom threshold of the mobile station based on the count.
